

## **CLAIMS**

This listing of claims will replace all prior versions, and listings, of claims in the application.

### **Listing of Claims:**

1. (Withdrawn) A computer-implemented method for transferring data to, or from, an implanted medical device (IMD) programming unit via a server arrangement that is coupled to a network, comprising:  
establishing communication connection between the server arrangement and the IMD programming unit; and  
in response to data received at the server arrangement and destined for the IMD programming unit, intercepting data contaminants in the received data.
2. (Withdrawn) The method of claim 1, further comprising, encrypting data exchanged between the IMD programming unit and the server arrangement.
3. (Withdrawn) The method of claim 2, further comprising programming the IMD programming unit with default user preference data stored in the server arrangement.
4. (Withdrawn) The method of claim 2, wherein the step of establishing the communications connection includes establishing a wireless communication connection.
5. (Withdrawn) The method of claim 2, further comprising denying unauthorized access to the IMD programming unit via the server arrangement.
6. (Withdrawn) The method of claim 1, further comprising programming the IMD programming unit with default user preference data.

7. (Withdrawn) The method of claim 1, wherein establishing the communications connection includes establishing a wireless communication connection.

8. (Withdrawn) The method of claim 1, and further comprising denying unauthorized access to the IMD programming unit via the server arrangement.

9. (Withdrawn) An apparatus for exchanging data with a plurality of implanted medical device (IMD) programming units via a server arrangement that is coupled to a network, comprising:

means for establishing communication connections between the server arrangement and the plurality of IMD programming units; and

means, responsive to data received at the server arrangement and destined for the IMD programming units, for intercepting data containing data contaminants.

10. (Previously Presented) A system for programming implanted medical devices (IMDs), comprising:

a data network;

a gateway server arrangement coupled to the data network;

an IMD programming unit to send data to, and retrieve data from, an IMD, the programming unit being coupled to the gateway server arrangement and comprising means for performing a self-discovery procedure to determine whether to initialize in a current mode or to reconfigure into a different mode that is based on software applications residing on the gateway server arrangement;

wherein the server arrangement includes a network interface intercepting data contaminants included in data received via the network and destined for the IMD programming unit[;] and includes a storage device wherein a portion of programmable instructions executed by the IMD programming unit are stored.

11. (Original) The system of claim 10, wherein the IMD programming unit and the server arrangement are further configured to exchange encrypted data.

12. (Original) The system of claim 10, wherein the server arrangement includes a radio signal transceiver coupled to the IMD programming unit.

13. (Original) The system of claim 12, wherein the server arrangement is coupled to the IMD programming unit by an electrically conductive wire.

14. (Original) The system of claim 13, wherein the server arrangement is coupled to the IMD programming unit by an optical fiber.

15. (Original) The system of claim 10, wherein the server arrangement is further configured to address the IMD programming unit using dynamic host Internet Protocol (IP) address assignments.

16. (Original) The system of claim 10, wherein the server arrangement is further configured to deny unauthorized access to the IMD programming unit that is attempted over the network.

17. (Original) The system of claim 10, wherein the server arrangement is coupled to multiple IMD programming units.

18. (Original) The system of claim 10, wherein the server arrangement is coupled to an administrative user interface provided to configure at least one of the server arrangement and the IMD programming unit.

19. (Original) The system of claim 10, wherein the server arrangement includes a storage device, and

wherein at least some of the data received via the network and destined for the IMD programming unit is stored in the storage device.

20. (Canceled)
